AI Internship — Chatbot Project Task Assignment

Beginner-Level AI Projects | Streamlit Interface + Deployment

Team Lead	Fazal Wahid
Role	AI Team Lead
Project Level	Beginner / Internship
Total Students	5
Technology Requirement	Python + Streamlit + LLM / AI APIs

1. Assignment Objective

Each intern will independently build a beginner-level AI chatbot. The project must include a functional Streamlit user interface, an AI-powered backend, basic error handling, documentation, and a deployed live version that can be accessed through a URL.

2. Project Assignments

Student 1 — FAQ Chatbot

Objective: Build a chatbot that answers user questions from a predefined FAQ dataset.

Core functionality: Create an FAQ knowledge base, retrieve the relevant question/answer, and return a clear response.

Student 2 — PDF Question-Answer Chatbot

Objective: Build a chatbot where users upload a PDF and ask questions about its content.

Core functionality: Extract PDF text, split it into useful chunks, retrieve relevant content, and generate answers based on the PDF.

Student 3 — Website Q&A; Chatbot

Objective: Build a chatbot that answers questions using the content of a given website.

Core functionality: Fetch or process the provided website content, create a searchable knowledge base, and answer questions from that content.

Student 4 — CSV Data Chatbot

Objective: Build a chatbot that allows users to upload a CSV file and ask questions about the data.

Core functionality: Process the CSV and support natural-language questions such as counts, filtering, comparisons, and basic statistics.

Student 5 — Document Summarizer + Q&A;

Objective: Build a chatbot that accepts a document, generates a summary, and answers questions about the document.

Core functionality: Support document upload, summarization, and question answering based on the uploaded document.

3. Common Technical Requirements

- Build the user interface using **Streamlit**.
- Use Python for the application logic.
- Integrate an appropriate LLM or AI API.
- Provide a simple chat-style interaction where applicable.
- Implement basic input validation and error handling.
- Keep the project code organized and understandable.
- Create a **README.md** containing setup instructions, project description, technologies used, and usage instructions.
- Maintain the project in a GitHub repository.
- Deploy the completed Streamlit application and provide a working public URL.
- Test the deployed application before submission.

4. Streamlit Interface Requirements

- Clear project title and short description.
- Simple and clean user interface suitable for a beginner project.
- Required file upload controls for projects that use files.
- Chat/input area for user questions.
- Visible AI responses.
- Loading/progress indication where appropriate.
- Clear error messages for invalid or unsupported inputs.
- A small section showing project information or usage instructions.

5. Deployment Requirements

Every student must deploy the final Streamlit application and submit the live URL. The deployed application should be accessible without requiring the reviewer to run the project locally.

- Deploy the Streamlit application using a suitable hosting platform.
- Configure required environment variables/API keys securely.
- Verify that the deployed application works after deployment.
- Test the main user flow using the live URL.
- Submit the live deployment URL together with the GitHub repository URL.

6. Final Deliverables

- Working GitHub repository
- Working deployed Streamlit application
- Live deployment URL
- README.md with setup and usage instructions
- Source code

- Sample/test data where required
- Short project demonstration
- Brief explanation of how the AI/chatbot pipeline works

7. Submission Checklist

Item	Required
Streamlit UI	Yes
AI / LLM integration	Yes
GitHub repository	Yes
README documentation	Yes
Deployed application	Yes
Live URL	Yes
Basic testing	Yes
Project demo	Yes

8. Evaluation Areas

Area	What will be checked
Functionality	Whether the chatbot performs its assigned task correctly.
AI Integration	Whether the AI/LLM is properly integrated into the application.
UI	Clarity and usability of the Streamlit interface.
Code Quality	Organization, readability, and basic error handling.
Documentation	Quality and completeness of the README.
Deployment	Whether the deployed application works through the submitted URL.
Understanding	Ability to explain the project and its workflow during the demo.
